

Transfer absence records from your timekeeping or data collection system into Abra Suite Attendance electronically with a BASpay Attendance Interface.

- **Faster Payroll Processing**
All payroll users know that Final Payroll processing slows as your history files grow in size. Conversely, keeping these files small offers significant speed improvements. The summarization option in the new BASpay Labor Interface combines multiple time records into one, which means fewer records end up in history to bog down your payroll.
- **Shorter payroll reports**
Since you can now summarize records before they are written to payroll, your Time Sheet Edit and Check/Direct Deposit Registers are much shorter, making them easier to review.
- **Time saving labor import routine**
The new Visual FoxPro 6.0 technology makes the labor import process run faster so you don't have to wait.
- **More accurate labor recording**
New cross-reference tables for organization levels, projects, and shifts allow you greater flexibility when importing. In the earlier labor interfaces, these fields had to contain the same codes in timekeeping as in payroll or they could not be imported. Now you can import and translate more information, providing truer labor recording in payroll.
- **Sophisticated labor cost analysis**
Since the new cross-reference tables allow you to post more accurate labor information to payroll, better labor cost analysis reports can be generated in payroll to show exactly which departments, jobs, and cost centers provide the largest payroll expense.
- **Easier mistake correction**
BAS understands that mistakes can happen. We've provided a new "unpost" feature that allows you to remove just the records from payroll that were written by the BASpay Labor Interface. Records that were entered into the payroll timesheets by hand do not have to be erased.
- **Enhanced Integration**
The BASpay Labor Interface has been rewritten using the latest Visual FoxPro technology. This provides better integration with other Visual FoxPro systems, especially Abra Suite version 6.0!
- **Labor reports that are easier to analyze**
Updated reporting makes your time data easier to review. The updated Detailed Activity Report shows only records that will be posted to payroll. Any records that contain exceptions are now excluded. The Payroll Post Report can show records in summarized form, making it easier to quickly skim the information.
- **Flexible data keys for fewer exceptions**
When employee numbers in the timekeeping system don't match the employee numbers in payroll, an exception is created. The updated labor interface program helps resolve this problem by providing more ways to match employee records. You can now store the time clock badge number in one of five miscellaneous fields in payroll and use that number to tie data together. Or use social security number to link timekeeping records to payroll.
- **Ensure correct pay amounts**
Integration with secondary jobs provides more pay rate options for job-driven labor.
- **Reduced chance of timesheet "surprises"**
The new Payroll Post Report displays data exactly as it will be written to payroll. Now you have a chance to make corrections before data reaches payroll in a format that you didn't expect. When you post summarized records, this report shows summarized records.
- **Management multiple labor files with less hassle**
For companies who import more than one labor file each period, the improved Labor File Identification automatically selects the correct Abra employer. Now you don't have to change the default employer whenever you change your labor file.
